

U74HC240

CMOS IC

OCTAL BUFFERS AND LINE DRIVERS WITH 3-STATE OUTPUTS

DESCRIPTION

The **U74HC240** is a octal buffer and line driver with 3-state outputs. It is organized as two 4-bit buffers/drivers with separate output-enable (\overline{OE}) inputs. When \overline{OE} is high, the Y outputs are in a high-impedance state and the outputs neither load nor drive the bus lines. When \overline{OE} is low, the device passes inverted data from the A inputs to the Y outputs.

The U74HC240 is designed to improve the performance and density of 3-state memory address drivers, clock drivers and bus-oriented receivers and transmitters.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pull-up resistor; and the minimum value of the resistor is determined by the current-sinking capability of the driver.

FEATURES

- * Wide supply voltage range from 2V to 6V
- * Max t_{pd} of 9 ns from A to Y at 6V
- * Low power consumption, $I_{CC} = 8 \mu A$ (Max.) at 6V
- * ± 6 mA output driver at 5V
- * Low Input Current of 1 μA Max
