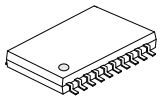
OCTAL TRANSPARENT D-TYPE LATCHES WITH 3-STATE OUTPUTS



TSSOP-20

■ DESCRIPTION

The **U74LVC563** is a octal transparent D-TYPE latches with 3-state outputs. When the latch-enable (LE) is high, the $\overline{Q}$ outputs follow the complements of the D inputs. When LE is low, the $\overline{Q}$ outputs are latched at the inverses of the levels set up at the D inputs.

When the output-enable ($\overline{OE}$) input is high, the $\overline{Q}$ outputs are in a high-impedance state, and the outputs neither load nor drive the bus lines. The high-impedance state and increased drive provide the capability to drive bus lines without interface or pull-up components. While the outputs are in the high-impedance state, old data can be retained or new data can be entered, i.e. $\overline{OE}$ does not affect the internal operations of the latches. When $\overline{OE}$ is low, the $\overline{Q}$ outputs are in a normal logic state (high or low levels).

The **U74LVC563** is designed for 1.65V to 3.6V operation. Inputs can be driven from either 3.3V or 5V devices, so the U74LVC563 can be used in a mixed 3.3V/5V system environment.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.
