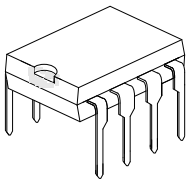
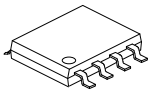
UC3842B/3843B

LINEAR INTEGRATED CIRCUIT

HIGH PERFORMANCE CURRENT MODE CONTROLLERS



DIP-8



SOP-8

■ DESCRIPTION

The UTC **UC3842B/3843B** are specifically designed for off-line and dc-to-dc converter applications offering the designer a cost-effective solution with minimal external components.

The **UC3842B** has UVLO thresholds 16V (on) and 10V(off), ideally suited for off-line converters. The **UC3843B** is tailored for lower voltage applications having UVLO thresholds of 8.4V(on) and 7.6V(off).

■ FEATURES

* Trimmed oscillator for precise frequency control
* Oscillator frequency guaranteed at 250kHz
* Current mode operation to 500kHz
* Automatic feed forward compensation
* Latching PWM for cycle-by-cycle current limiting
* Internally trimmed reference with undervoltage lockout
* High current totem pole output
* Undervoltage lockout with hysteresis
* Low startup and operating current

■ PIN DESCRIPTIONS

PIN NO.	PIN NAME	I/O	DESCRIPTION
1	COMP	O	Error amp output to provide loop compensation maintaing V_{FB} at 2.5V
2	V_{FB}	I	Error amp inverting input, The non-inverting input of error amp is 2.5V band gap reference
3	CS	I	Current sense input to PWM control gate drive of output
4	R_TC_T	I	To set oscillator frequency and maximum output duty cycle
5	GND		Power ground
6	OUTPUT	O	To direct drive power MOSFET
7	V_{CC}		Power supply
8	V_{REF}	O	5V regulated output provides charging current for C_T through R_T

Note: 1. Adject V_{CC} above the Startup threshold before setting to 15V.

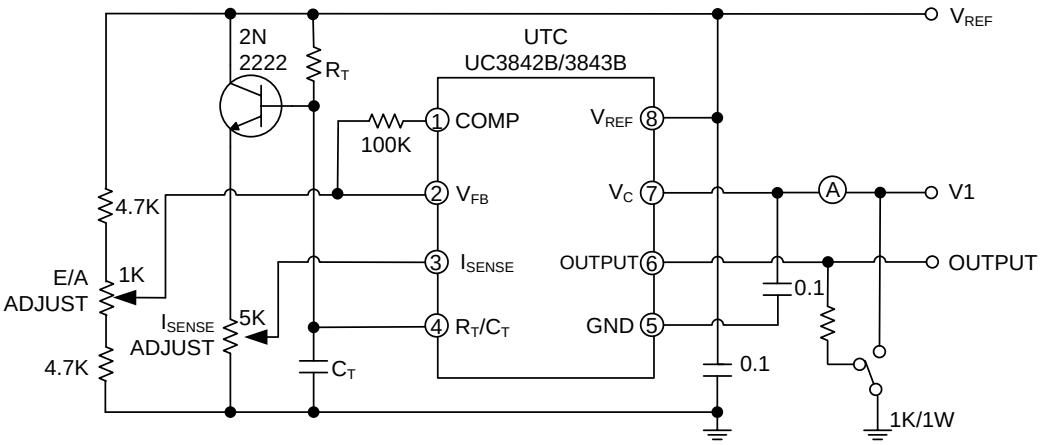
2. This parameter is measured at the latch trip point with V_{FB}=0V.

3. Comparator gain is defined as : G_V $\frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$

■ TYPICAL APPLICATION CIRCUIT

Open Loop Test Circuit

All of the parameters are not all tested in production, although been guaranteed. The timing and bypass capacitors must be connected to Pin 5 in a single point ground very closely. To sample the oscillator waveform, the transistor and 5kΩ potentiometer are used, and also can apply an adjustable ramp to I_{SENSE} Pin.

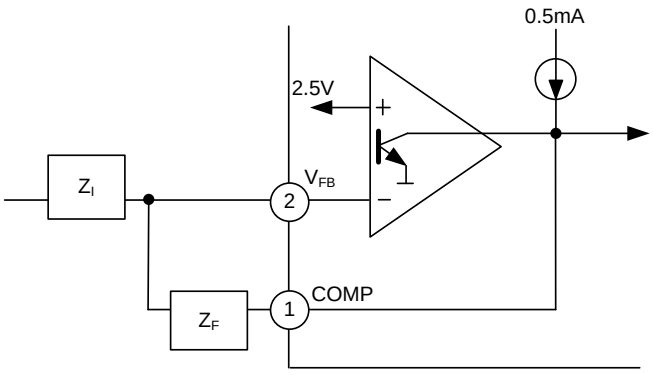


Under Voltage Lockout

Under-Voltage Lock-Out: the output driver is biased to a high impedance state. To prevent activating the power switch with output leakage current, Pin 6 should be shunted to ground with a bleeder resistor.

	V_{ON}	V_{OFF}
UC3842B	16V	10V
UC3843B	8.4V	7.6V

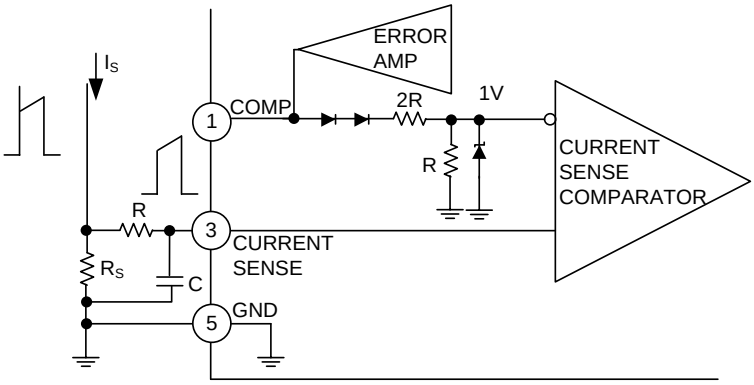
Error Amp Configuration



Error amp can source sink up to 0.5mA

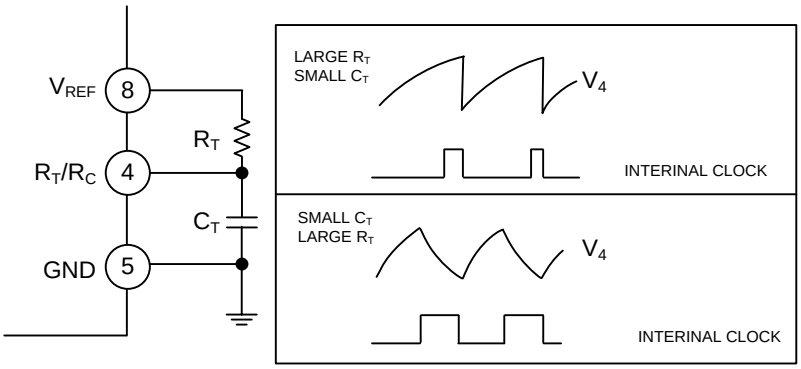
■ APPLICATION INFORMATION (Cont.)

Current Sense Circuit



Peak current (I_S) is equaled:
$I_{S(MAX)}$=1.0V/R_S
There should be a small RC filter to suppress switch transients.

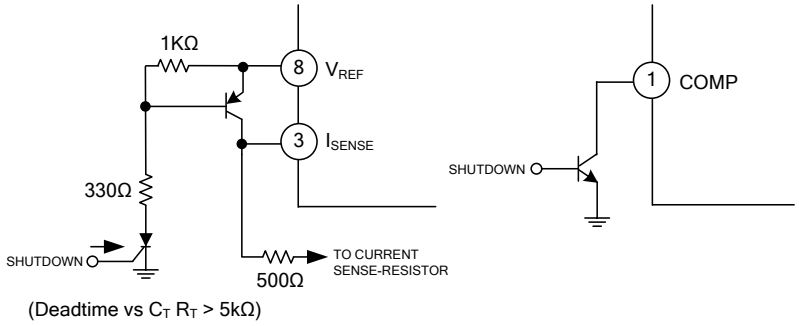
Oscillator Waveforms and Maximum Duty Cycle



C_T (Oscillator timing capacitor) can be charged by V_{REF} through R_T and discharged by an internal current source. At discharge time, the internal clock signal blanks the output to the low. Both oscillator frequency and maximum duty cycle can be determined by Selection of R_T and C_T.

■ APPLICATION INFORMATION (Cont.)

Shutdown Techniques



(Deadtime vs C_T R_T > 5kΩ)

The UTC **UC3842B's** shutdown can be accomplished by two ways: raise Pin 3 above 1V; or pull Pin 1 below a voltage two diode drops above ground. Either method can cause the PWM comparator's output to be high. Because the PWM latch is reset dominant, the output will remain low until the next clock cycle after the shutdown condition at Pins 1 and/or 3 is removed.
